

Our contribution to a cleaner and **greener** environment:

» 450 solar panels

» 60% of our annual energy usage

During peak sunlight hours, we generate approximately double the energy we use and feed that back onto the grid.

Over 25 years our system is estimated to offset:

- 3,936,601 kWh of electricity
- 6,175,349 lbs of CO₂ emissions
- 19,817 lbs of NO_x which creates smog
- 17,939 lbs of SO_x which causes acid rain
- 1,220 lbs of particulates that cause asthma

That's the environmental equivalent of:

10,047,909 miles driven in an average car,
or taking 32.6 cars off the road for 25 years,

or
planting 52.9 acres of trees.
